ABSTRACT

DYNAMIC PARAMETER MODIFICATION

Methods and apparatus for the dynamic modification of parameters existing
within computing systems are described. An application program runs a Graphical User
Interface (GUI) having a navigator panel 152 and an edit panel 154. An XML textual file
160 is written to the application GUI 150 by Java™ code. The navigator panel 152
represents the XML file in a tree structure having groups of parameters. When a
particular parameter is selected, it is caused to appear in the edit panel 154, where its
attributes (textual) can be added or modified. The modified parameter is then persisted to
a database 170.
